A; Note: he authors translated the codon GAA for residue 1460 as Gln, and GAG for residue C; Comment: Prolines and lysines at the third position of the tripeptide repeating unit (C are 5-bydroxylated and subsequently O-glycosylated.
C; Comment: The amino-terminal propeptide domain appears not to be completely cleaved.
                                                                                                                                                                                                                                                                                                                                              Indels 174; Gaps

-!- FUNCTION: Type I collagen is a member of group I collagen (fibrillar forming collagen).

-!- FUNCTION: Trimers of one alpha 2(I) and two alpha 1(I) chains.

-!- TISSUB SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
unit Main Same of the chains.
-!- SIMILARITY: Belongs to the fibrillar collagen family.
-!- SIMILARITY: Contains I WWFC domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Monson J.M., Friedman J., McCarthy B.J.;

PTM: Proline residues at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains. Pro-1153 is the only 3-hydroxypro and the only hydroxylated proline in position X.

SIMIGARITY: Belongs to the fibrillar collagen family.

SIMILARITY: Contains 1 WFC domain.
                                                                                                                                                      "Amino acid sequence of chick skin collagen alpha 1(I)-CB8 and complete primary structure of the helical portion of the chick collagen alpha 1(I) chain.",
 Finer M.H., Aho S., Gerstenfeld L.C., Boedtker H., Doty P., "Unusual DNA sequences located within the promoter region and first intron of the chicken pro-alpha 1(1) collagen gene.", J. Biol. Chem. 262:13323-13332(1987).

Composition useful as substitute for plasma, comprises solution of saline and recombinant gelatin-like protein having colloid osmotic function.

Example 1; SEQ ID NO 4; 31pp; English

The present sequence is the protein sequence of recombinant gelatin-like protein Hu-deam. A claimed composition suitable as a substitute for plasma comprises a solution of saline and a protein having a colloid osmotic function. The protein is a recombinant gelatin-like protein with a molecular weight of at least 10 kDa and at most 50 kDa and an colloid seclectric point of less than 8. It is especially Hu-1 ADM48390 or Hu-1 certamer of the protein, is useful as a plasma expander that has a lower tetramer of the protein, is useful as a plasma expander that has a lower claramce rate from blood circulation, provides better and predictable regulation of clearance rate and which is less susceptible to protecolytic degradation than presently used galatin derivatives. Recombinant gelatin-colline protein with blood samples containing IgE to an immunological reaction with blood samples containing IgE antibodies. The gelatin-like proteins can be covalently attached to pharmaceutically active compounds. After administration, the coupled

medicament will not diffuse from the circulating blood into the interstitium. Clearance by liver and kidney will be kept to a minimum, ensuring a more constant plasma level of the medicament. Suitable medicaments include those involved in intervening blood clotting, vasodilation, function of erythrocytes, thrombocytes and leukocytes, immune responses, and blood levels of messenger molecules such as

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily characted prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the nucleic acid sequence into the cell; and contacting the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid. Coll with a hypertonic growth medium containing at least one amino acid, into the cell and incorporated into the extracellular matrix protein. The control of proteins assimilated into the cused to make host cells assimilate and incorporate trans-4-bydroxyproline into proteins. This is especially useful in the combinant production of proteins such as collagen, fibrinogen and companied to proteins such as collagen, fibrinogen and companied of proteins also useful in studying the structure and function of proline. The recombinance remained to the post translational hydroxyproline. The recombinance remained as also useful in studying the structure and function of proline. The research of proteins remained to the post translational hydroxyproline.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and connecting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acid, into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the cells matchinant production of proteins such as collagen, fibringen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The proteins expensents human collagen i (alphal) helical region, which may be produced using the method of the invention

Sequence 1057 AA

for

e.g.

```
The present sequence represents a human type 1 (alphal) collagen protein. Peptides derived from the protien were used to demonstrate incorporation of 3.4-debydro-L-proline into the peptide, using the method of the invention. The specification describes a method for the incorporation of non-natural amino acid into a polypeptide. The method comprises reacting epoxidation reagent from a polypeptide ontaining at least one 3,4-epoxyproline residue. The method is used for studying the effects of non-natural amino acids on structure and function of polypeptides. The method is also useful for commercial production of collagen or mussel adhesive proteins (which are useful as bloadhesives), and for incorporating a wide variety of grougs, including therapeutic ligands and biological probes,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A fusion protein (AAR89472) comprises the alpha-helical region of human collagen I(a) linked to amino acids 46-93 of human mature dermatan subhate proteoglycan (decorin). It can be expressed in Escherichia coli transformants carrying a vector incorporating a chimeric gene (AAT16518) coding for the fusion. The decorin binds to type I collagen and thus affects Elbril formation. It inhibits the cell attachment-promoting activity of collagen and fibrinogen by binding to such molecules near their cell binding sites. The collagen moiety provides an integral substratum or scaffolding for the decorin. The fusion protein acts to reduce scarring of healing tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 GSEGPEGVRGEPGPPGPAGAAGPAGDPGADGEPGAKGADGAPGIAGAPGFPGARGPSGPE

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-codo into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The proteins depends which do not normally contain trans-4-hydroxyproline. The present sequence represents a chimeric collagen 1 (alphal)/decorin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                        This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.

A fusion protein (AAR89469) comprises the alpha-helical region of human collagen I(a) linked to the human mature bone morphogenic protein 2B (BMP2B). It can be expressed in Escherichia coli transformants carrying a vector incorporating a chimeric gene (AAT16515) coding for the fusion. The BMP moiety induces osteogenesis, while the collagen moiety provides an integratal substratum or scaffolding for the BMP and cells involved in reconstruction and growth. The fusion protein provides sustained release and delivery of BMP to a target tissue
                                                                                                                                                                                                                                                9
